Assignment 2 – Titanic Data Analysis Final Report

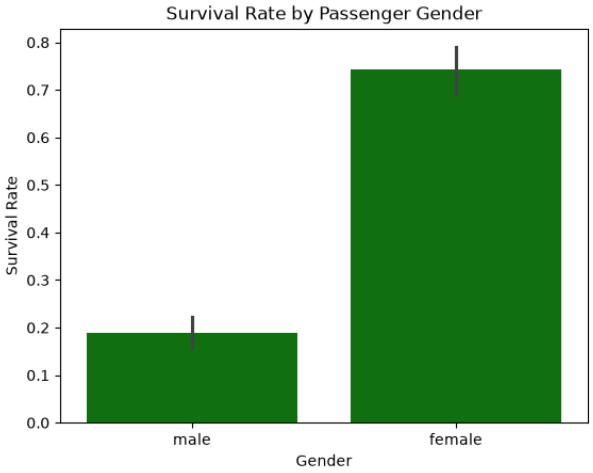

Hypothesis One:
Survival Rate vs. Passenger Class

The survival rate was associated with passenger class. First-class passengers had the highest survival rate, followed by second-class passengers and third-class passengers.

Hypothesis Two:
Survival Rate vs. Passenger Gender

The survival rate was associated with gender. Female passengers had a much higher survival rate than male passengers. The bar chart suggests a strong association between gender and survival. Female passengers were more likely to survive than male passengers.

Hypothesis Three:
Survival Rate vs. Age

The survival rate was not exactly associated with age. Although the distributions shown in the two graphs (Survived vs. Did Not Survive) are similar, they still show a higher rate in the 0–20 age group. Therefore, we can assume that the survival rate was not strongly associated with age overall.
